

PARTNER CONFIRMATION FORM
COP 3710 - Database Project with Service Learning
Fall 2026

NOTE: In lieu of this form, an email from the partner confirming the partnership also works. However, the team must provide all the required information below in their project report. You can include a screenshot of the email or print it in your report.

STUDENT TEAM INFORMATION

Team Number:

Team Members:

- | | |
|----------------------|---|
| 1. Cristobal Ornelas | Email: cdornelashernand6740@eagle.fgcu.edu |
| 2. Nicolas Wiesner | Email: nwiesner8602@eagle.fgcu.edu |
| 3. Suhaib Farah | Email: smfarah9239@eagle.fgcu.edu |
| 4. Lucas Benchak | Email: lwbenchak7657@eagle.fgcu.edu |

COMMUNITY PARTNER INFORMATION

Organization Name: The School District of Lee County

Contact Person: Mary Graham

Contact Title/Position: Teacher on Assignment, School District of Lee County

Email: maryegr@leeschools.net

Phone: 239.335.1551

Brief Description of Organization Mission:

The School District of Lee County's Healthy Living Collaboration seeks to build Healthy Minds and Bodies using Gardens as a living classroom for curriculum integration.

CONFIRMATION

By signing below, we confirm our partnership for the COP 3710 Database Project (Fall 2026). The student team will design and develop a database system to address the organization's data management needs.

Student Team Lead Signature:

Print Name: Cristobal Ornelas

Date: Sept 11, 2026

Community Partner Signature: Mary Graham

Print Name: Mary Graham

Date: Sept 11, 2026

DUE: Sept 14, 2026

Goal: Understand what they need and agree on our project scope.

Attendees: Mary Graham, Leisha Roy, Cristobal Ornelas, Nicolas Wiesner, Suhaib Farah, Luke Benchak

One person takes notes: key discussion points, problems, and identified data needs.

Meeting Checklist

- **Current system**

- Show how they currently work.

The organization currently uses Google Sheets to manage garden-related information

- What data do you currently collect?

They collect information related to school gardens, inventory and supplies, garden components, and growing information

- Who uses or updates the data?

School district staff involved with the garden program likely use and update the data, including staff responsible for managing garden information, inventory, and supplies.

- **Problems & needs**

- What problems are you having with the current system?

Their current tracking systems could use improvement and refinement. They would like a better centralized tracking system for the garden program

- What would you like to improve?

They would like to improve centralized tracking to support long-term efficiency, sustainability, and clear reporting. Their existing inventory management, supply request, distribution, and restocking system also need refinement.

- **Database needs**

- What information needs to be tracked or easily accessed?

Seed stocks, tools, soil, equipment, garden footprints, irrigation setups, composting units, active bed counts, planting schedules, crop rotations, and seasonal variations.

- What reports or questions should the database answer?

The database should make it easy to see current inventory levels, identify supplies that may need restocking, view garden information by school, and track planting and growing schedules

- **Scope**

- What should we focus on for this project?

The three areas identified, in priority order, are Inventory & Supplies, Garden Sizes & Components, and Growing Calendars & Crop Rotations

- What would make the finished database useful?

A centralized system that helps with tracking garden-program information and supports efficiency, sustainability, and clear reporting

- **Future**

- Anything you'd eventually like the system to do?

A future web application could provide an easier way to view, add, update, and manage the garden information stored in the database

- **End**

- Summarize what we understood and confirm it with Mary.

The organization currently uses Google Sheets for garden information and would like a better centralized tracking system. The main areas identified are inventory and supplies, garden sizes and components, and growing calendars and crop rotations.

Project Proposal

Project Objective

The objective of this project is to design and develop a centralized database system for Lee County's Environmental Education programs. The organization currently needs a more organized way to manage information related to its materials inventory, budgets, and storage locations. The proposed database will provide a structured system for storing and connecting this information so that the organization can more easily determine what resources it has, where those resources are located, and where they have been distributed.

The database will organize information about agricultural materials and supplies, including the quantity of each item, its location, associated costs. The system may also maintain records of materials distributed to other locations or programs. This will allow the organization to maintain a clearer picture of its available resources and how those resources are being used.

The goal is to produce a system that the organization can continue to use and maintain after the project is completed.

Community Partner Overview

Community Partner: Lee County School District – Environmental Education

Mission: The Environmental Education Program will provide instruction, resources and experiences that empower the students and staff of Lee County Schools as they learn about their environment.

During the initial meeting with the community partner, the organization identified a need for improved management of information associated with its agricultural programs. The organization needs to keep track of its available inventory, where materials are stored, the financial resources associated with those materials.

Scope of the Project

The project will focus on designing and implementing the database structure necessary to support the partner's resource management needs.

In Scope

The project will include:

- Designing a relational database for agricultural program information.
- Creating tables for inventory items and their relevant characteristics.
- Tracking inventory quantities and associated locations.
- Recording costs and budget-related information.
- Recording the distribution or movement of materials to other locations or programs.
- Establishing relationships between inventory, funding, locations, and distributions.
- Providing documentation explaining the database structure and how the organization's data should be managed.

The database will be developed using **Supabase/PostgreSQL** as the primary database platform. This will provide the organization with a hosted database that can be maintained after the student project is completed.

Out of Scope

The following items will not be included unless the project scope is later expanded with approval from the community partner:

- Development of a complete public-facing website.
- Development of a mobile application.
- Automated purchasing or payment processing.
- Automated grant application submission.
- Full accounting or financial-management software.
- Integration with unrelated third-party business systems.
- Advanced artificial intelligence or predictive analytics.
- Management of information unrelated to the organization's agricultural programs.
- Long-term data entry and administrative work performed by the student team after project completion.

The project will prioritize creating a strong and maintainable database rather than attempting to build an entire software platform around it. Additional functionality could potentially be added by the organization in the future if its needs change.

Dataset Description

The database will manage information across the three main areas identified by the community partner: Inventory & Supplies, Garden Sizes & Components, and Growing Calendars & Crop Rotations. This includes seed stocks, tools, soil, equipment, supply distribution and restocking, garden footprints, irrigation setups, composting units, active bed counts, planting schedules, crop rotations, and seasonal variations. The database will use text, numeric values, dates, and unique identifiers to organize and connect this information.

Impact

The proposed database will give the School District of Lee County's Environmental Education Program a more centralized and structured way to manage information related to its agricultural materials and resources. The database will connect information about inventory and supplies, Garden sizes and components, and growing calendars and crop rotations.

This will make it easier for the organization to determine what resources are available, where those resources are located, and where materials have been distributed. The database will also provide a more organized way to manage information that is currently tracked through Google Sheets and other existing processes.

Overall, the database will provide a structured and maintainable system for managing the organization's garden program information. It will also establish the database groundwork that could support additional functionality, such as a frontend application, if the organization chooses to expand the system in the future.

Database System Development APPROVED
